

Middle School-Wide WWPF FAQs:

Your school or organization cares about your child's heart health. By partnering with Who We Play For to offer ECG (electrocardiogram) heart screenings to all students, we will be able to help detect potentially life-threatening heart defects that can lead to Sudden Cardiac Arrest and are missed on a standard physical more than 96% of the time.

What is Sudden Cardiac Arrest (SCA)?

Sudden Cardiac Arrest (SCA) is the immediate loss of electrical function of the heart caused by an abnormal heart rhythm called ventricular fibrillation. SCA occurs suddenly, without warning, and causes the heart to stop pumping blood to the body. Sudden Cardiac Arrest is not the same as a heart attack.

Sudden Cardiac Arrest is:

- The **#1 Killer of Student Athletes** in the United States, accounting for 75% of all athlete-related deaths
- The **#1 Killer of Students** while on school campuses, two-thirds occurring with exercise or activity
- The **#2 Medical Cause of Death** in all of our children
- The **First reported symptom** in half of all cases is SCA

Why should my child get a cardiac screening?

The human body, including the heart, changes during puberty in various ways. Because of these physical changes and the increased stresses on an active young heart, a cardiac screening should be part of a physical at least every two years.

Electrocardiogram (ECG) screening can help detect problems before they become major medical issues. While we recommend all students get an ECG, your child should definitely be screened if they:

- Have a family history of heart disease or SCA
- Experience dizziness or fainting spells during or after exercise/activity
- Experience extreme fatigue or unusual shortness of breath during or after exercise
- Experience chest pain during exercise
- Experience racing or irregular heartbeats

How much will this cost?

An ECG screening with WWPF is FREE with the option to donate. Who We Play For, AdventHealth, Nemours Children's Hospital, Orlando Health, The NASCAR Foundation, Simply Healthcare, and RIPITT Foundation have provided generous donations toward the cost of this program. Normally, an ECG with WWPF is \$20 compared to a doctor's appointment with an ECG, which may cost \$150 or more. It is our core belief that every child deserves to have their heart checked, so we will continue to make these screenings as affordable as possible. Our goal is that no child will be turned away due to lack of funds.

How is the cardiac screening done?

Cardiac screening with an ECG can detect various potentially fatal diseases that disturb a heart's normal electrical function, such as Hypertrophic Cardiomyopathy (HCM), Long QT Syndrome, and Wolff-Parkinson-White Syndrome (WPW).

An ECG records the electrical activity of the heart and measures the electrical signals the heart uses to contract and circulate blood through the body and lungs. An ECG involves placing electrodes on the chest around the heart to record those signals. Once the screening is complete, a cardiologist will review your child's ECG to decide on your child's heart health. The test is easy, painless, non-invasive, and takes less than 5 minutes to perform. It does not involve needles, blood work, radiation exposure, or sedation.

How often do you find a problem?

Statistics show that **1 in 300 youth have an undetected heart condition** that puts them at risk for SCA. Statistics also show that 1 in 500 youth have a heart condition called Hypertrophic Cardiomyopathy (HCM), which is the most common cause of Sudden Cardiac Arrest/Death in people under the age of 30. If our cardiologists determine your child's ECG is abnormal, their consultation will most often include a recommendation for an echocardiogram (Echo) to take a better look at the heart. The Echo is used to get a picture of the heart, similar to an ultrasound used to look at a baby during pregnancy. The Echo looks for heart valve and vein structure abnormalities, muscle thickness, and proper heart function.

Will I see the results of my child's ECG?

Yes. After the ECG is interpreted, the results will be returned to you within 10 business days,

identified as either low-risk, follow-up, or high-risk. A copy of the ECG will be returned along with information about the potential abnormalities our cardiologists identified and how you should proceed with your child's medical care. Low-risk results are returned via email. Any abnormal results will be shared by a phone call from a WWPF Heart Health Advocate to walk through the findings. **Once your child's ECG is returned, we encourage you to share it with your child's pediatrician so they can add it to your child's medical records.**

Who reads the ECG?

Who We Play For has a team of cardiologists who read every electrocardiogram WWPF performs. They have many years of experience and are qualified to read according to the International Criteria.

What if my child needs a follow-up?

An abnormal ECG flagged as follow-up means additional testing is needed to see what is causing the abnormality identified on the ECG – think of it as a yellow caution light. The consultation will include documentation on what the potential abnormalities may be, as well as resources with cardiologists serving your community that you can connect with to continue your child's medical care. If your child is flagged as a follow-up, typically, he or she can continue participating in the school's sports program and their normal exercise/activity routine. However, per our cardiologist's medical direction, your child must visit a cardiologist within 3 months to determine why their ECG was abnormal.

What if my child is considered high-risk?

If your child is flagged as high risk, it is like a red traffic light. He or she should not participate in sports or exercise/activity in any way (practice, games, scrimmages, etc.) until he or she has seen a specialist and received clearance or treatment. WWPF will provide you with resources with cardiologists serving your community that you can connect with to continue your child's medical care.

Isn't this covered with the annual physical?

The cardiac exam of the annual physical is limited to family and personal health history questions and requires a doctor to listen to the student's heart with a stethoscope. Studies have shown that this is less than 4% effective at identifying abnormalities that may lead to SCA. The addition of an ECG screening can increase the effectiveness by up to 80-95%. WWPF's cardiologists have special training and years of experience with pediatric ECGs, which results in more accurate exams.

Do we need to do this every year?

ECG screening should be a part of the physical at least every other year through middle school and high school due to the physical changes and increased stresses on a developing youth's heart that occur during that time frame. However, encourage your children to be open and honest about how they physically feel, and if your child begins to experience any of the symptoms listed above at any time, take immediate action with your child's physician.

Are boys and girls screened together?

No, boys and girls must be screened separately so arrangements are made for privacy. Boys and girls may need to remove their shirts. Girls, however, should wear a regular bra or sports bra, which will not need to be removed.

Where can I find out more information?
